Douglas Sellers

Phoenix, AZ | (602) 829-1427 | doug@dougsellers.info | www.dougsellers.info

SUMMARY

Full-stack software engineer with 4+ years building enterprise internal applications across distributed, service-oriented architectures. Comfortable across the stack with React, Node.js, .NET Core, Java, and Go; experienced designing and consuming REST and GraphQL APIs and integrating LLMs into production-style applications. Track record of leading systems end-to-end—from data modeling and batch ingestion through API delivery and UI—and guiding peer engineers across components in cloud environments (AWS, Kubernetes, OpenShift).

SKILLS

Languages: JavaScript/TypeScript, C# / .NET Core, Java, Go, Python, SQL

Frontend: React 16/18, Next.js, TanStack Query, Mantine, unit testing (Jest)

Backend & APIs: Node.js, .NET Core, Spring Boot, REST API design, GraphQL integration, batch processing, distributed systems

Cloud & DevOps: AWS (Lambda, API Gateway, S3, CloudWatch, X-Ray, Secrets Manager), Terraform, Kubernetes, OpenShift, Docker, CI/CD pipelines

Practices: SRE / SLO monitoring, canary deploys, feature flags, LLM / GenAI integration, Okta SSO, vendor integration

PROFESSIONAL EXPERIENCE

Software Engineer II — USAA, Remote June 2025 – Present

- Lead developer and de facto technical owner of a new internal employee photo delivery system that ingests vendor data into a managed database and exposes a .NET Core REST API consumed by downstream enterprise applications. Designed the data model, batch ingestion jobs, and API contract; coordinate component ownership across peer engineers contributing to different parts of the system.
- Mentor and guide peer engineers building adjacent components of the photo system through design and code review, unblocking technical decisions and aligning interfaces across the project.
- Built React 18 UI for an Email Distribution List management tool using TanStack Query and Mantine; delivered stories at a pace that pulled completion forward by two sprints.
- Hackathon: shipped an AI-powered tool that converts video recordings into written documentation with embedded images and step-by-step instructions. Built the React UI and the orchestration layer that coordinated with a Python LLM service, generating PDF and Markdown outputs.
- Maintain enterprise C# tooling, internal NuGet libraries, and CI/CD pipelines used by multiple teams across the department.
- Department subject matter expert for SRE practices including SLO definition and monitoring, canary deploys, and feature-flag-driven rollouts.

Software Engineer II — USAA, Phoenix February 2024 – June 2025

- Delivered a high-performance .NET batch job in 3 weeks to ingest 80k+ Workday employee records into a vendor intranet platform, reducing processing time from hours to minutes.
- Primary technical owner of the enterprise internal email communications platform, including vendor integration, REST API consumption, and three supporting batch jobs.
- Maintenance lead for a portfolio of 14 applications spanning Java Spring REST APIs, .NET Core MVC APIs, React clients, and .NET Core 8 batch jobs; reduced technical debt and managed vulnerability remediation across the portfolio.
- Primary developer on a Go REST API hosted in AWS using API Gateway, Lambda, VPC, CloudWatch, X-Ray, and Secrets Manager, with infrastructure defined in Terraform.
- Migrated an internal React 16 application to React 18 and refactored hundreds of unit tests as part of a hosting platform move from Kubernetes to S3-based static hosting.
- Maintained an enterprise short-link redirect service running as a containerized .NET API alongside a containerized Spring Boot admin service backing a React admin UI; integrated React clients with internal GraphQL APIs to display enterprise data.

Software Engineer III — USAA, Phoenix January 2022 – February 2024

- Solo implementation engineer for the rollout of a new internal email communications platform: Okta SSO configuration, three OpenShift-containerized C# .NET batch jobs, and end-to-end vendor coordination, delivered in 6 months.
- Solo developer for an internal event website (6 fully featured pages, ~6,000-employee user scope) and built trigger-activated Salesforce APEX automation in 2 weeks during an internal business application migration.
- Identified and retired unused applications, saving the team $4,000/month in maintenance costs.

EDUCATION

B.S., Information Technology — Networking and Computer Systems Security December 2021

Ira A. Fulton Schools of Engineering, Arizona State University — GPA 3.92 — Dean's List (Spring 2018 – Spring 2021)
